## Some Change in Apportionment Allocations With New 2017 Census Estimates; But Greater Change Likely by 2020

New Census Bureau population estimates for 2017 released today shows a change of two more seats between four states from last year's study generated by Election Data Services, Inc. on which states would gain or lose congressional seats if the current numbers were used for apportionment in 2017. But projecting these numbers to 2020, using several different methods, leads to more states being impacted by the decennial census scheduled to take place in just three years.

The Bureau's 2017 total population estimates shows that now 12 states will be impacted by changes in their congressional delegation if these new numbers were used for apportionment today. The state of Colorado joins the previously indicated states of Florida, North Carolina, and Oregon to each gain a single seat while the state of Texas is now shown to gain a second seat with the new data. The states of New York and West Virginia joins the states of Illinois, Michigan, Minnesota and Pennsylvania to lose a seat in Congress using the new data.

The new numbers, however, reflect subtle changes taking place across the nation in birth and death rates and resulting total population numbers that become magnified when the information is projected forward to coincide with the taking of the 2020 Census on April 1 that year. A short-term projection method, utilizing the change in population in just the past year (20162017), would trigger a second seat lost to Illinois and an actual loss of a seat to California, the first time that state has lost a congressional seat in its nearly 160 -year history. The state of Montana would gain an additional seat using the short-term projection methodology (going from the at-large seat they've had for the last three decades back to a two-member house delegation), while the state of Minnesota would keep its eighth seat that seems to be lost using the long-term change methodology (2010-2017). The long-term change methodology also indicates Illinois would only lose one seat by 2020, getting the last seat in the allocation (\#435) with only 36,803 people to spare.

Using either methodology the population projections points toward a nine (9) or ten (10) seat change over 15 to 17 states across the nation come 2020. States that will gain single seats include

Arizona, Colorado, North Carolina, and maybe Oregon and Montana, while Florida is set to gain two congressional districts and Texas could gain three seats. Single seat losses will again occur in the Midwest and Northeast sections of the nation, where Alabama, Michigan, New York, Ohio, Pennsylvania, Rhode Island and West Virginia, as well as possibly Minnesota would each lose a seat and Illinois could lose either one or two seats. All other states would keep the same number of representatives they were awarded in December 2010 when the official 2010 Census numbers were released.

Using the new sets of projected 2020 data, the apportionment calculations show that 15 to 17 states could gain or lose districts by the time the Census is taken in 2020 in three years. The gainers and losers are:

## States Gaining Districts (6 or 7)

## States Losing Districts (9 or 10)

| Arizona +1 (from 9 to 10) | Alabama -1 (from 7 to 6) |
| :--- | :--- |
| Colorado +1 (from 7 to 8) | California even or -1 (possibly from 53 to 52) |
| Florida +2 (from 27 to 29) | Illinois -1 or -2 (from 18 to 17 or 16) |
| Montana even or +1 (from At-large to 2) | Michigan -1 (from 14 to 13) |
| North Carolina +1 (from 13 to 14) | Minnesota -1 or even (from 8 to 7 or no change) |
| Oregon +1 (from 5 to 6) | New York -1 (from 27 to 26) |
| Texas +3 (from 36 to 39) | Ohio -1 (from 16 to 15) |
|  | Pennsylvania -1 (from 18 to 17) |
|  | Rhode Island -1 (from 2 to 1) |
|  | West Virginia -1 (from 3 to 2) |

Today's Census Bureau press release accompanying the release of the population estimates notes that Idaho is the nation's fastest growing state in the past year, followed by Nevada and Utah. But this population growth has not impacted these state's congressional allocation, at least not yet. The 2017 numbers show Idaho would stay at two seats, and miss gaining an additional seat by 118,406 people. But projecting the numbers forward to 2020 using the short-term methodology shows Idaho only 30,824 away from gaining a third seat. All the population projection methodologies keep the state of Nevada at four seats and sufficiently away from any margins of a fifth possible seat. Utah is similar in that it would take more than 125,000 extra people for the state to gain a fifth district.

Since 1941, by law the number of seats in the U.S. House of Representatives has been capped at 435. As a result, there has always been interest in finding which states are close to that magic bubble, either just gaining their last seat, or just missing their next seat. The following table shows the results of the 2017 population estimates, as well as the short-term trend methodology calculations for the seats within five positions of the 435 cut-off.

| 440 | Arizona (10th) | 92,005 | 440 | Idaho (3rd) | 30,824 |

Kimball Brace, President of Election Data Services, Inc. cautioned users to take the projections as very preliminary and subject to change. "The change in administration and the lack of a Census Director could have a profound impact on how well the 2020 Census is conducted, and therefore the counts that are available for apportionment," Brace noted. "Having worked with Census data and estimates since the 1970s, it is important to remember that major events like Katrina and the 2008 recession each changed population growth patterns and that impacted and changed the next apportionment," he said.

Brace also noted that major changes in the counting process are in the works for 2020 and that reduced budget funding could impact those plans. "History can also be a guide, recalling that the 1920 apportionment was cancelled because the numbers showed for the first time that more people resided in urban areas than rural areas" said Brace.

The new 2017 estimates also point to how close a number of states stand to gain or lose a district. Most notable are the states of:

California - For the last several decades California's population growth has been relatively flat when compared to other states. While the state gained seven congressional districts between 1980 and 1990, it gained only one district the following decade and no additional seats between 2000 and 2010. The long-term change methodology seems to continue that trend with no additional seat change, but the 2016-2017 short-term change methodology point towards the state actually losing a congressional district in 2020, the first time in the state's history. This short-term change methodology points toward California just losing a seat by only 47,642 people.

Rhode Island - While keeping their two congressional districts with the 2017 numbers, the new data shows the state is now only 157 people away from dropping to a single dis-
trict state. This has steadily decreased over the decade so far. Last year the state was 5,569 people away from losing its' second seat, and in 2015 the margin was 16,130 and in 2014 they kept the second seat by only 21,389 in population The 2010 Census gave Rhode Island their second seat but with only 52,481 people to spare. At this rate, they will be down to just one district in the next several years, the first time this has occurred to Rhode Island since 1789 when the nation was formed. This is confirmed in the 2020 study data. They would join seven other states that also just have a single representative in the US House (Alaska, Delaware, Montana, North Dakota, South Dakota, Vermont and Wyoming). Note that one projection method shows Montana gaining a second seat.

#### Abstract

Montana - The state is at the cusp of gaining back it's second seat in Congress. The middle-change methodology (2014-2017) showed the state securing seat \#435 with just 642 people to spare. The short-term methodology (2016-2017) gives Montana it's second seat with 5,914 people to spare. On the other hand, the long-term methodology keeps Montana with only a single seat in Congress.

Minnesota - The state is close to staying even or losing a seat. The short term methodology shows Minnesota keeping its $8^{\text {th }}$ seat with only 6,791 people to spare, but the longer term trends both indicate the state would drop down to seven (7) congressional districts in 2020.

Because congressional apportionment also impacts the Electoral College and the vote for President, Election Data Services took the 2020 projections for each state and applied the Presidential election results from the past five Presidential contests to determine the Electoral College outcomes in the past 16 years. The study shows that none of the presidential contests would have elected a different presidential candidate using the new apportionment counts but they would have been more Republican in nature. For example, in 2016 President Trump would have gained an additional electoral college vote under the new apportionment projections. In 2012 President Obama would still have won the Electoral College, but with four less votes ( 328 vs 332 ) that he won at the time of the voting. The biggest change would have occurred in the 2000 presidential election where George Bush would have gained an additional 19 electoral votes had the new 2020 apportionment projections determined the number of congressional seats in each state.

The 2016 Electoral College was muddled because 7 electors voted for a different candidate than what they had pledged based on the vote totals. As a result, the overall change in candidate votes based on the new apportionment numbers shows just one vote difference in the bottom line results. President elect Trump's ability to carry states that will be losing congressional seats in 2020 also contributed to a reversal of the pattern depicted in previous elections.

It should be noted that the 2020 Presidential election and resulting electoral college will occur before the results of the 2020 Census are released by December 31, 2020. Therefore, the electoral college results in 2020 will be governed by the state's apportionment allocation as they exist today, having been first determined in 2011. The first time the new 2020 apportionment results will be utilized will be the 2024 Presidential election. Election Data Services, Inc. has also worked with the website 270 ToWin , who has built an interactive map of the these new ap-

portionment results where users can adjusts state outcomes to discover electoral college outcomes for the presidential elections back to 2000.

Major weather events have also affected apportionment. The Census Bureau's estimated populations released for 2005 showed Louisiana would keep all their congressional districts that decade. Even the Bureau's own projections for 2010 released that same year showed Louisiana staying the same. Then hurricane Katrina hit Louisiana at the end of August 2005 (after the date of the population estimates). Devastation and population loss impacted New Orleans in a major way, and when the Bureau's 2006 population estimates were released Louisiana was looking at losing a congressional seat. That was ultimately confirmed when the 2010 Census was taken, and state data was released at the end of that year.

The year of 2017 saw 18 hurricanes and tropical storms, three of which have the potential of impacting population movements in the US. However, all three significant storms (Harvey (affecting Houston area), Irma (impacting Miami and the Florida Gulf Coast), and Maria (which devastated Puerto Rico)) occurred in August and September 2017, after the date of coverage for the Census Bureau's population estimates released today. "It won't be until next year when we see whether population lost in Houston was enough to keep Texas at gaining only two districts instead of three." noted Brace. "And while Irma may have cut down some population in Florida, Maria's wide-spread and on-going impact in Puerto Rico has reportedly led to more than a quarter million American citizens to move to Florida, mainly in the center of the state." Brace said. The 2017 study released today showed Florida missed gaining a 29th seat by only 366,735 people. It won't be until the 2018 estimates are released next year that the storm's impact will be seen in the numbers.

The 2017 population estimates have not been statistically adjusted for any known undercount. In addition, no estimates were provided for U.S. military personnel overseas. This component has in the past been counted by the Census Bureau and allocated to the states. Overseas military personnel have been a factor in the apportionment formula for the past several decades, including the switching of the final district in 2000 that went from Utah to North Carolina. Observers are also awaiting the Census Bureau's and/or Trump administration's release of the "residency rules" that will dictate where college students, the military, and prisoners will be counted in the 2020 census, which in turn could impact the apportionment process. The lack of a Census Director could also have an impact on how well the Census is conducted, and therefore the quality of the apportionment numbers.

Past apportionment studies by Election Data Services, Inc. can be found at https://www.electiondataservices.com/reapportionment-studies/. A historical chart on the number of districts each state received each decade from 1789 to current is also available at this web address and linkable at https://www.electiondataservices.com/wp-content/uploads/2014/10/CD-apportionment-1789-2010.pdf.

Election Data Services Inc. is a political consulting firm that specializes in redistricting, election administration, and the analysis of census and political data. Election Data Services, Inc. conducts the congressional apportionment analyses with each annual release of the census population estimates. For more information about the reapportionment analysis, contact Kimball Brace (703-580-7267 or 202-789-2004 or kbrace@electiondataservices.com).
