## New Population Estimates Point to Significant Issues in Recent Supreme Court Case

New Census Bureau population estimates for 2020 released today shows a subtle but significant change in the upcoming apportionment process, that is front and center in the Supreme Court's decision last week in New York $v$. Trump. The population impacts whether the state of New York loses either one or two congressional districts and whether that seat goes to Alabama if the current estimate numbers were used for apportionment in 2020. These numbers are only estimates and reflect a normal Census Bureau practice of generating population estimates each year from reviewing birth, death and immigration records. These ARE NOT reflecting results from the actual 2020 Census collection efforts from this year, as those numbers are not expected out until sometime in January 2021.

Today's population estimates reflect numbers as of July 1, 2020, after the official date of April 1, 2020 that is commonly used for Census Day. In all other years of this decade, Election Data Services has aged (added to) the population estimates released yearly by the Census Bureau an additional nine months to bring them in line with Census Day. Because today's population estimates are pegged to a date after Census Day, for this year's study we have subtracted a quarter of the year's growth to move the estimates back to April 1, 2020. While this was done for consistence with previous studies this decade, the Covid pandemic has caused changes in Census practices for the actual counting process in 2020, most importantly in drawing out the timetable for survey collection. As a result, we are releasing apportionment estimates for both April 1, 2020 and July 1, 2020.

That subtle three month change in population estimates will determine whether Alabama loses a Congressional District, as the back-dated April 2020 data shows the loss by only 5,170 people (that seat would have been \#436 in the apportionment process, one away from the 435 cut-off point.) The state of Alabama is currently involved in a court case called State of Alabama v. US Department of Commerce where the state has made the claim that their loss of a congressional
district is due to the inclusion of illegal aliens in the census count. But Alabama's loss would change to no-change in their number of Congressional Districts if the new Census estimates for July 1 were instead used for apportionment. Alabama would keep their $7^{\text {th }}$ seat (seat \#435) by only 6,120 people to spare without regard to whether illegal aliens were counted in the census or not.

Ironically, the Alabama seat would shift to the state of New York and determine whether the state will lose a single seat or two seats in the apportionment process. Under the back-dated April 2020 data, New York would only see a single seat lose, instead keeping their $26^{\text {th }}$ seat (seat \#435) by only 20,337 people. But the July population estimates shows New York loosing two congressional districts, that second seat by only 24,428 people. The State of New York is not only the lead Plaintiff in the New York v. Trump court case but also a Defendant-Intervenor in the Alabama case.
"It's pretty ironic that these two states are themselves demonstrating how close the apportionment process coming from this year's Census really is," said Kimball Brace, President of Election Data Services. Brace noted that the Supreme Court last week withheld a ruling in the New York vs Trump case on whether the current administration could change the apportionment numbers because of illegal aliens. "This new study shows that states will be affected by the Census process." Brace said.

These population numbers, and this resulting study, should be viewed as preliminary and will be subject to a number of different circumstances that will be occurring over the next month. First, the Bureau is expected to release their initial actual counts of the residential populations that were counted for each of the 50 states, likely to be released in January 2021. Second, the Bureau will add to the residential populations the counts of military overseas, but these numbers are expected to be lower than previous decades giving the change in methodology in how the military is counted this decade. The new Bureau procedures will place many of the military back at their homes stateside and therefore will be reflected in the residency population. Third, the Trump Administration is seeking to exclude illegal aliens from the population data used for apportionment and this is very likely to change the apportionment projections, particularly for the states that are close to the 435 cut-offs for how many seats are given out in apportionment. All three of these circumstances will lead to a new apportionment process in January, and Election Data Services, Inc. will be generating a new study at that time.

The Bureau's 2020 total population estimates show that 10 congressional districts are likely to shift between 17 states that will be impacted by changes in their congressional delegation if these new numbers were used for apportionment today. The states of Arizona, Colorado, Montana, North Carolina, and Oregon to each gain a single seat, while the state of Florida would gain a second seat and the state of Texas would gain a third seat with the new data. Single seat losses will occur in the state of Alabama (dependent upon data used), California, Illinois, Michigan, Minnesota, New York (possibly two seats), Ohio, Pennsylvania, Rhode Island, and West Virginia using the new data. Maps of both sets of the 2020 numbers are attached.

Since our last apportionment study (dated December 30, 2019 and available on our website) the state of Florida is now showing a two seat gain, while last year's study only showed a single seat gain. The other changes in the past year have been cited above, with the potential changes in New York and Alabama. All other anticipated changes in the apportionment counts were already unveiled last year.

The new 2020 data confirms that California will lose a congressional district in 2020 and the margin of that loss is growing larger. Our 2018 study first picked up the possibility that California could lose a congressional district for the first time in their nearly 160-year history. The 2019 study indicate the state would lose that seat by 98,709 people but the new 2020 data shows the state is nearly a half-million away from being able to keep their $53^{\text {rd }}$ seat.

The state of Montana hold on going back to two seats (they had two seats from 1910 to 1990 when they went back to a single seat) is still very tenuous. The new 2020 data shows the state able to gain the second seat by only 4,714 people, the closest margin in today's study

Rhode Island is also a state with an extremely close margin. For most of the decade our studies have projected that Rhode Island would lose their second seat by the end of the decade and the new numbers confirm that projection. But their margin has gotten tighter with the new data. For the past several years we saw that Rhode Island would lose that second seat by more than 25,000 people. But this new data shows the state missing the seat by only 16,842 or 16,970 residents depending upon which month's data is reviewed.

In table form, the gainers and losers are:

## States Gaining Districts (7)

Arizona +1 (from 9 to 10)
Colorado +1 (from 7 to 8)
Florida +2 (from 27 to 29)
Montana +1 (from At-large to 2)
North Carolina +1 (from 13 to 14)
Oregon +1 (from 5 to 6)
Texas +3 (from 36 to 39)

## States Losing Districts (10)

```
Alabama no change or -1 (from 7 to 6)
California -1 (from 53 to 52)
Illinois -1 (from 18 to 17)
Michigan -1 (from 14 to 13)
Minnesota-1 (from 8 to 7)
New York -1 or -2 (from 27 to 26 or 25)
Ohio -1 (from 16 to 15)
Pennsylvania -1 (from 18 to 17)
Rhode Island -1 (from 2 to 1)
West Virginia -1 (from 3 to 2)
```

Since 1941, by law the number of seats in the U.S. House of Representatives has been capped at 435. As a result, there has always been interest in finding which states are close to that magic bubble, either just gaining their last seat, or just missing their next seat. The following table shows the results of the 2020 population estimates, both for the April, 2020 projections and the July, 2020 estimates.
2020 Reapportionment Analysis
2020 Projections (April)

## 2020 Reapportionment Analysis

| Next Sea |  | Margin of Loss | Next Seats M |  | Margin of Loss |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 436 | New York (26 ${ }^{\text {th }}$ ) |  | 436 | Alabama (7th) | 5,170 |
| 437 | Minnesota (8th) | 25,554 | 437 | Minnesota (8th)) | 31,931 |
| 438 | Ohio (16 ${ }^{\text {th }}$ ) | 71,495 | 438 | Ohio (16th) | 74,900 |
| 439 | California (53rd) | 499,080 | 439 | California (53rd) | 496,052 |
| 440 | Virginia (12 ${ }^{\text {th }}$ ) | 134,381 | 440 | Rhode Island (2 $2^{\text {nd }}$ ) | ) 16,970 |

The Census Bureau's yearly release of population estimates also results in a revision of previous year estimates. While Election Data Services has traditionally reflected those revisions in our projection methodology, we have created a new apportionment table that shows the apportionment results for each year in the decade based upon those revised numbers. The table, entitled "2020 Apportionment Calculations based on different trend lines coming from the 2020 Census Bureau Estimates" is attached to this press release. The table shows consistent gains and losses of seats over the entire decade with the new data. The table also includes a chart of where seats \# 430 through \# 440 would be assigned to states in each projection.

Kimball Brace, President of Election Data Services, Inc. cautioned users that the final official apportionment numbers to be released in the next month are likely to be somewhat different from today's study. "It is still uncertain how well the Trump Administration and the Census Bureau conducted this year's census, so the final apportionment numbers will be closely watched for any indications of problems," Brace noted. "The Covid virus through a big question-mark on the Census, probably worse than Katrina or the 2008 recession." said Brace.

Because congressional apportionment also impacts the Electoral College and the vote for President, Election Data Services took the 2020 projections for each state and applied the Presidential election results from the past six Presidential contests to determine the Electoral College outcomes back to 2000. The study shows that none of the presidential contests would have elected a different presidential candidate using the new apportionment counts but they would have been more Republican in nature. For example, in 2016 President Trump would have gained two additional electoral college votes under the new apportionment projections. In 2012 President

Election Data Services, Inc. "2020 Reapportionment Analysis"
December 22, 2020
Page 5 of 6
Obama would still have won the Electoral College, but with four less votes (328 vs 332 ) than he won at the time of the voting. The biggest change would have occurred in the 2000 presidential election where George Bush would have gained an additional 20 electoral votes had the new 2020 apportionment projections determined the number of congressional seats in each state.

The 2016 Electoral College was muddled because 7 electors voted for a different candidate than what they had pledged based on the vote totals. As a result, the overall change in candidate votes based on the new apportionment numbers shows just two vote difference in the bottom line results. President elect Trump's ability to carry states that will be losing congressional seats in 2020 also contributed to a reversal of the pattern depicted in previous elections.

It should be noted that the 2020 Presidential election and resulting Electoral College occurred before the results of the 2020 Census are released next month. Therefore, the Electoral College results in 2020 were governed by the state's apportionment allocation as they exist this past decade, having been first determined in 2011. The first time the new 2020 apportionment results will be utilized will be the 2024 Presidential election. Election Data Services, Inc. has also worked with the website 270 ToWin , who has built an interactive map of the these new apportionment results where users can adjust state outcomes to discover Electoral College outcomes for the presidential elections back to 2000.

The 2020 population estimates have not been statistically adjusted for any known undercount that may take place when the Census is conducted. In addition, no estimates were provided for U.S. military personnel overseas. This component has in the past been counted by the Census Bureau and allocated to the states based on administrative records retained by the military. Overseas military personnel have been a factor in the apportionment formula for the past several decades, including the switching of the final district in 2000 that went from Utah to North Carolina.

For 2020 the Census Bureau has changed the "residency rules" for counting the military by creating a distinction between personnel who are deployed overseas (usually for short periods of time) compared to those who are stationed or assigned overseas (frequently for longer periods of time). The Bureau will use DOD's administrative records to count deployed personnel at their usual residence in the US for both apportionment and redistricting purposes (they will be embedded within the state's resident population counts). On the other hand, personnel who are stationed or assigned overseas will be counted to their "home state of record" for apportionment purposes only and will show up as part of a state's total "overseas count" when the Bureau releases the final and official apportionment data by next month. Military sources have told the Census Bureau that of all overseas military, approximately $15 \%$ are deployed personnel and $85 \%$ are stationed or assigned overseas.

Past apportionment studies by Election Data Services, Inc. can be found at https://www.elec-tiondataservices.com/reapportionment-studies/. A historical chart on the number of districts each state received each decade from 1789 to current is also available at this web address and linkable at https://www.electiondataservices.com/wp-content/uploads/2014/10/CD-apportionment-17892010.pdf.
